3. sudoadd-apt-repositoryppa:wireshark-dev/stable

```
lab2-25@lab225-B250M-D2V:~$ sudo add-apt-repository ppa:wireshark-dev/stable
PPA publishes dbgSYM, you may need to include 'main/debug' component
Repository: 'deb https://ppa.launchpadcontent.net/wireshark-dev/stable/ubuntu/ jammy main'
Description:
Latest stable Wireshark releases back-ported from Debian package versions.

Back-porting script is available at https://github.com/rbalint/pkg-wireshark-ubuntu-ppa

From Ubuntu 16.04 you also need to enable "universe" repository, see:
http://askubuntu.com/questions/148638/how-do-i-enable-the-universe-repository

The packaging repository for Debian and Ubuntu is at: https://salsa.debian.org/debian/wireshark

## Practical No:- 14

**Aim: Program to assign IPv4 Addresses in NS3.**

**Code:**

```
#include "ns3/core-module.h"
#include "ns3/network-
module.h" #include
"ns3/internet-module.h"
#include "ns3/point-to-point-

module.h" using namespace ns3;

int main(int argc, char* argv[]) {
    // Create a node container
    NodeContainer nodes;
    nodes.Create(3);

    // Create two point-to-point helpers
    PointToPointHelper pointToPoint1,
    pointToPoint2;
    pointToPoint1.SetDeviceAttribute("DataRate",
    StringValue("5Mbps"));
    pointToPoint1.SetChannelAttribute("Delay", StringValue("2ms"));
    pointToPoint2.SetDeviceAttribute("DataRate",
    StringValue("5Mbps"));
    pointToPoint2.SetChannelAttribute("Delay", StringValue("2ms"));

    // Create two net device containers and install devices
    NetDeviceContainer devices1, devices2;
    devices1 = pointToPoint1.Install(nodes.Get(0), nodes.Get(1));
    devices2 = pointToPoint2.Install(nodes.Get(1), nodes.Get(2));

    // Install Internet stack on nodes
    InternetStackHelper internet;
    internet.Install(nodes);

    // Assign IP addresses
    Ipv4AddressHelper ipv4;
    ipv4.SetBase("10.1.1.0",
    "255.255.255.0");
    Ipv4InterfaceContainer interfaces1 = ipv4.Assign(devices1);
    Ipv4InterfaceContainer interfaces2 = ipv4.Assign(devices2);

    // Print assigned IP addresses
    for (uint32_t i = 0; i < interfaces1.GetN(); ++i) {
        std::cout << "Node " << i << " has IPv4 address " << interfaces1.GetAddress(i) <<
        std::endl;
    }
    for (uint32_t i = 0; i < interfaces2.GetN(); ++i) {
        std::cout << "Node " << i+1 << " has IPv4 address " << interfaces2.GetAddress(i) <<
```

```
std::endl;  
}  
  
    Simulator::Run();  
    Simulator::Destroy();  
  
return 0;  
}
```

## Output:

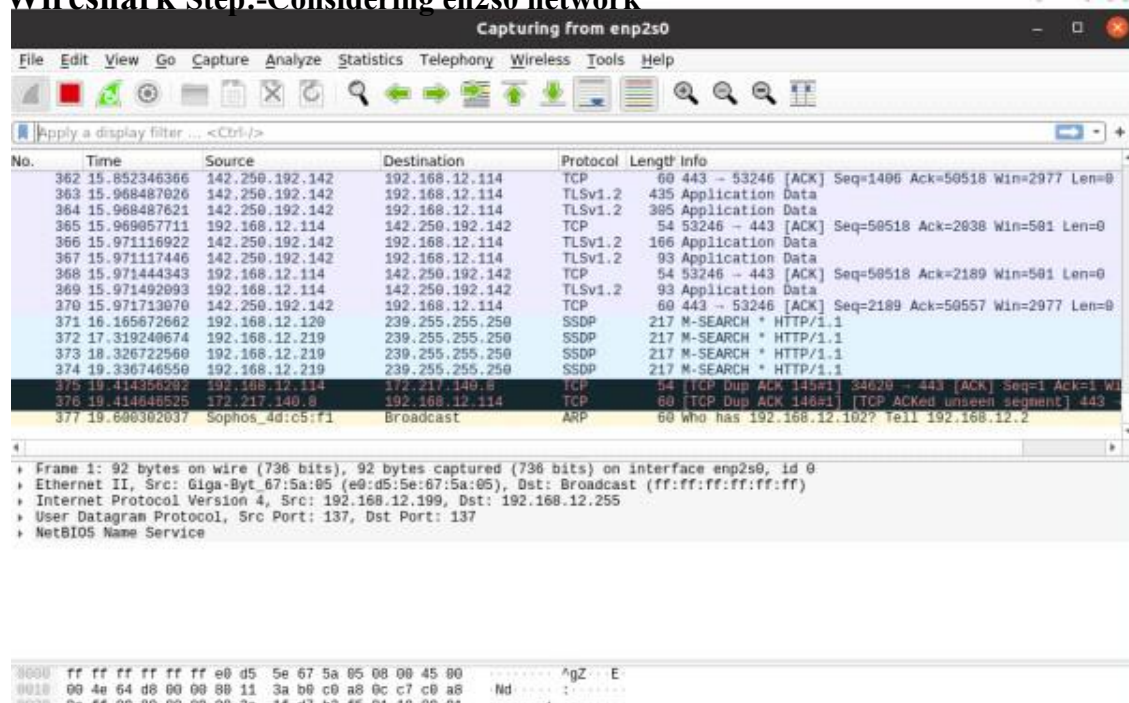

A terminal window with a dark purple background and light green text. The prompt is 'lab2-56@lab256-H610M-H-DDR4:~/Desktop/ns-allinone-3.36.1/ns-3.36.1\$'. The command entered is './ns3 run scratch/IPv4'. The output shows 'Consolidate compiler generated dependencies of target scratch\_IPv4' followed by four lines of node information: 'Node 0 has IPv4 address 10.1.1.1', 'Node 1 has IPv4 address 10.1.1.2', 'Node 1 has IPv4 address 10.1.1.3', and 'Node 2 has IPv4 address 10.1.1.4'. The prompt is then shown again.

```
lab2-56@lab256-H610M-H-DDR4:~/Desktop/ns-allinone-3.36.1/ns-3.36.1$ ./ns3 run scratch/IPv4  
Consolidate compiler generated dependencies of target scratch_IPv4  
Node 0 has IPv4 address 10.1.1.1  
Node 1 has IPv4 address 10.1.1.2  
Node 1 has IPv4 address 10.1.1.3  
Node 2 has IPv4 address 10.1.1.4  
lab2-56@lab256-H610M-H-DDR4:~/Desktop/ns-allinone-3.36.1/ns-3.36.1$
```

## Practical No - 16

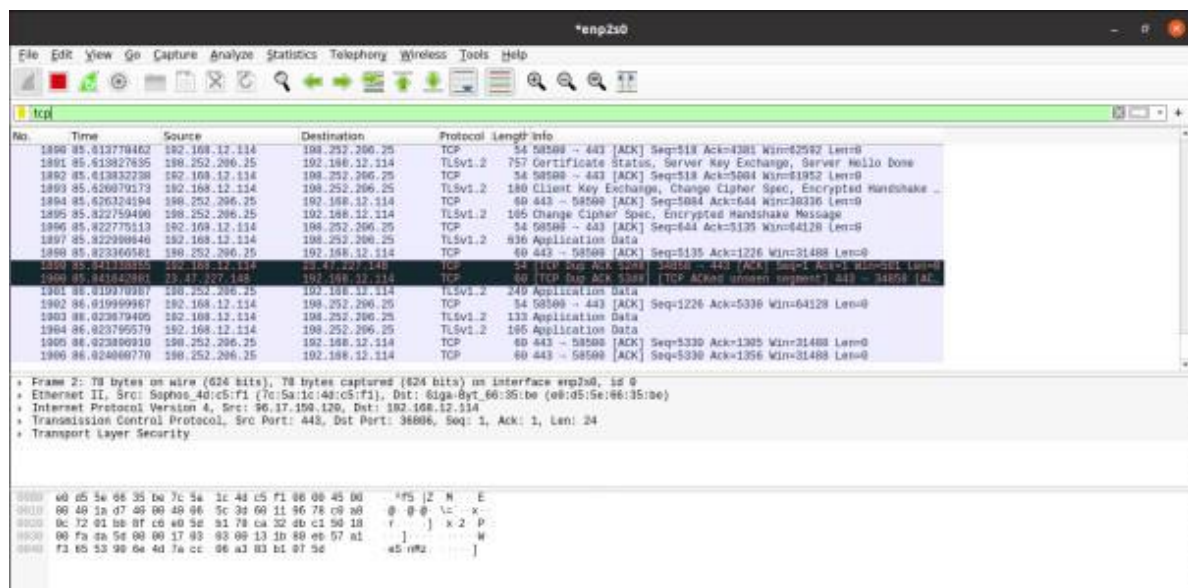

**Aim:** Analyze the performance parameter of the network using Wireshark.

**Steps:**

1. ssl

2. TCP

## 3. ARP

Wireshark capture of ARP traffic on interface enp2s0. The packet list shows multiple ARP requests and responses. The packet details pane shows the structure of an ARP request. The packet bytes pane shows the raw hex and ASCII data.

No.	Time	Source	Destination	Protocol	Length	Info
2855	115.873834288	Sophos_4d:c5:f1	Broadcast	ARP	60	Who has 192.168.12.182? Tell 192.168.12.2
